

SUN SECURE GLOBAL DESKTOP

SECURE AND MANAGED ACCESS TO DATA AND APPLICATIONS

Sun Secure Global Desktop Software provides secure access to server-based applications running on Microsoft Windows, Solaris, Linux, HP-UX, AIX, Mainframe and Midrange systems from a wide variety of client platforms and devices. The software web-enables legacy applications quickly without costly re-writes and delivers those applications side-by-side with modern server-based applications. This allows for consolidation of critical applications and data onto highly reliable, centrally maintained servers and off individual desktop and laptop computers, improving manageability while increasing flexibility. Sun Secure Global Desktop Software allows you to:

- Access applications from nearly any location on the internet over a secure connection without specialised hardware
- Reduce costs by centralizing management of users and applications
- Enable auditing of application usage
- Dramatically reduce the time to securely deliver applications
- Ensure users can access only applications they are authorised to use
- Increase resiliency by housing application sessions at the data centre and not on individual PCs
